EXHAUST AIR OR RECIRCULATION

Cooking vapours have to go somewhere. We explain the differences between recirculation and exhaust air systems and what actually happens to the cooking vapours.

With the BORA exhaust system, the fan channels cooking vapours straight outside through the BORA Ecotube duct system and the BORA 3box wall sleeve. This removes all vapours and odours from the cooking area. As, unlike conventional flow volume, less warm inside air is expelled from the house, thereby saving energy.

The BORA recirculation system is the alternative solution to exhaust-air variants. The fan directs the cooking vapours into the specially developed recirculation filters, which effectively eliminate odours from the kitchen exhaust air. As such, the BORA recirculation systems keep the air in kitchens fresh. As the recirculation systems keep the warm air in the house, they are ideal for passive houses as well as low and nearly zero-energy buildings.

BORA TECHNICAL SUPPORT

In our technical support department all employees have extensive experience in customer service and orientation. They are active members of our office and field staff. Our colleagues in the office are a highly competent point of contact when end customers need help with our appliances, for whatever reason. Often, error analysis over the phone is enough to solve the problem promptly without the need to send someone out. The service technicians in the field, on the other hand, process and perform service tasks face to face, representing BORA in person.

In the event of any queries, please contact our technical support team: support.apac@bora.com, +61 297 19 2350
